

## Claims:

1. A plasma equipment seasoning method comprising the steps of:  
measuring the ratio of optical emission intensity of silicon oxide ( $\text{SiO}_x$ )-  
based chemical species to optical emission intensity of carbon fluoride compound  
5 ( $\text{CF}_y$ )- based chemical species present in a process chamber of plasma equipment  
before operating the plasma equipment to perform a plasma process;  
determining whether the value of the measured optical emission intensity  
ratio is within a predetermined range of normal state or not; and  
when reaction gas to be used in the plasma process is supplied into the  
10 process chamber based on the result of determination such that the value of the  
measured optical emission intensity ratio is within the predetermined range of  
normal state, seasoning the interior of the process chamber to change the ratio of  
components of the reaction gas, and thus, to change the optical emission intensity  
ratio.
- 15 2. The method as set forth in claim 1, wherein the optical emission  
intensity ratio measuring step comprises:  
supplying the reaction gas to be used in the plasma process into the process  
chamber, changing the reaction gas into a plasma state, and performing  
spectroscopic analysis through optical emission measurement.
- 20 3. The method as set forth in claim 1, wherein the seasoning step  
comprises:  
if the value of the measured optical emission intensity ratio is above the  
upper limit value of the predetermined range of normal state,  
performing first seasoning to supply first reaction gas having relatively  
25 increased percentage of a component that increases the optical emission intensity of  
the carbon fluoride compound ( $\text{CF}_y$ )-based chemical species, among components of  
the reaction gas, into the process chamber; and  
if the value of the measured optical emission intensity ratio is below the  
lower limit value of the predetermined range of normal state,  
30 performing second seasoning to supply second reaction gas having

relatively increased percentage of a component that increases the optical emission intensity of the silicon oxide ( $\text{SiO}_x$ )-based chemical species, among components of the reaction gas, into the process chamber.

4. The method as set forth in claim 3, wherein

5 the reaction gas to be used in the plasma process includes carbon tetrafluoride ( $\text{CF}_4$ ) and oxygen gas ( $\text{O}_2$ ),

the component that increases the optical emission intensity of the carbon fluoride compound ( $\text{CF}_y$ )-based chemical species at the first seasoning step is the carbon tetrafluoride ( $\text{CF}_4$ ), and

10 the component that increases the optical emission intensity of the silicon oxide ( $\text{SiO}_x$ )-based chemical species at the second seasoning step is the oxygen gas ( $\text{O}_2$ ).

5. Plasma equipment comprising:

15 a process chamber having an inner space defined therein for performing a plasma process;

a plasma generating coil disposed on the process chamber for generating plasma;

20 an optical emission spectroscopic analysis unit mounted to the wall of the process chamber for spectroscopically analyzing chemical species present in the process chamber;

25 an optical emission intensity ratio value calculation unit for calculating the ratio of optical emission intensity of silicon oxide ( $\text{SiO}_x$ )-based chemical species to optical emission intensity of carbon fluoride compound ( $\text{CF}_y$ )-based chemical species from the results collected and spectroscopically analyzed by the optical emission spectroscopic analysis unit and comparing the value of the calculated optical emission intensity ratio with a predetermined range of normal state to determine whether seasoning is necessary and what kind of seasoning is appropriate if the seasoning is necessary; and

30 a main control unit for controlling supply of reaction gas introduced into the process chamber to perform the seasoning based on the determination of the optical emission intensity ratio value calculation unit.
